

## Hypothesis Haven puts the “S” in STEM with the launch of their science enrichment programs

Provider of innovative education solutions, Hypothesis Haven, announces the launch of their programs to Houston, TX and surrounding areas

Hypothesis Haven is looking to give children the best possible foundation for a career in science as the company announces their official launch. The education solutions provider offers two distinct programs – school-based Science Clubs and vacation Break Camp. Hypothesis Haven focuses on K-5th-grade students, teaching them the steps that scientists take to find answers to medicine’s biggest questions.

“I’ve always been passionate about sharing my experiences in the medical research field with the next generation of young scientists. I’ve mentored high school and college students in the past, but recognized that there is untapped potential in even younger kids,” said Bridget Chapital, MEd, Hypothesis Haven Founder and Director.

Studies have shown that children easily grasp things they are exposed to, even at early ages. Children have been discovered to be curious about the world around them and can be pretty daring. However, while many after-school STEM clubs focus on coding and robotics, there are not many that focus on health science. This is where Hypothesis Haven is looking to make a difference in the educational system by helping kids to develop their interest through early exposure to rewarding science careers. The education solutions provider aims to leverage children’s curiosity in the classroom, making science more enjoyable and allowing students experiment, ask questions, and try to figure out for themselves what happens and why.

The company has already started to receive accolades from parents in and around Houston thanks to the fantastic programs offered. The Hypothesis Haven Science Club is an after-school enrichment program offered at participating elementary schools in Houston, TX and surrounding areas. Students get the opportunity to learn about the many systems of the human body and practice basic science techniques. Under the tutelage of qualified staff, participating students engage in hands-on, interactive projects that explore how the power of science drives medical breakthroughs.

The Hypothesis Haven Break Camp is an educational childcare option during breaks in the academic school year. The week-long camp is designed to introduce grade school students to mind-blowing medical breakthroughs and the scientists that discovered them.

Hypothesis Haven will be offering two Winter Break Camp sessions in December 2019 with registration for the 4-day sessions opening on November 1.
